Deep learning

1.5. High dimension tensors

François Fleuret
https://fleuret.org/dlc/

A tensor can be of several types:

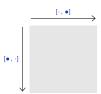

- torch.float16, torch.float32, torch.float64,
- torch.uint8,
- torch.int8, torch.int16, torch.int32, torch.int64

and can be located either in the CPU's or in a GPU's memory.

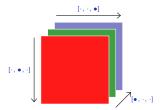

Operations with tensors stored in a certain device's memory are done by that device. We will come back to that later.

```
>>> x = torch.zeros(1, 3)
>>> x.dtype, x.device
(torch.float32, device(type='cpu'))
>>> x = x.long()
>>> x.dtype, x.device
(torch.int64, device(type='cpu'))
>>> x = x.to('cuda')
>>> x.dtype, x.device
(torch.int64, device(type='cuda', index=0))
```

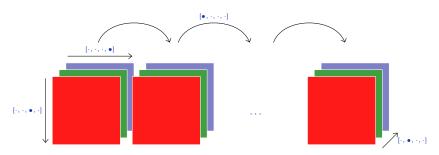

2d tensor (e.g. grayscale image)

3d tensor (e.g. rgb image)

4d tensor (e.g. sequence of rgb images)

Here are a few examples from the immense library of tensor operations:

Creation

- torch.empty(*size, ...)
- torch.zeros(*size, ...)
- torch.full(size, value, ...)
- torch.tensor(sequence, ...)
- torch.eye(n, ...)
- torch.from_numpy(ndarray)

Indexing, Slicing, Joining, Mutating

- torch.Tensor.view(*size)
- torch.cat(inputs, dimension=0)
- torch.chunk(tensor, nb_chunks, dim=0)[source]
- torch.split(tensor, split_size, dim=0)[source]
- torch.index_select(input, dim, index, out=None)
- torch.t(input, out=None)
- torch.transpose(input, dim0, dim1, out=None)

Filling

- Tensor.fill_(value)
- torch.bernoulli_(proba)
- torch.normal_([mu, [std]])

Pointwise math

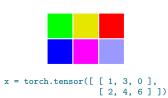

- torch.abs(input, out=None)
- torch.add()
- torch.cos(input, out=None)
- torch.sigmoid(input, out=None)

Math reduction

- torch.dist(input, other, p=2, out=None)
- torch.mean()
- torch.norm()
- torch.std()
- torch.sum()

BLAS and LAPACK Operations

- torch.linalg(a)
- torch.linalg(A, B)
- torch.inverse(input, out=None)
- torch.mm(mat1, mat2, out=None)
- torch.mv(mat, vec, out=None)

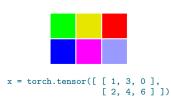

x.view(-1)

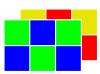

x[:, 1:3]

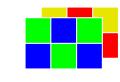

x.view(1, 2, 3).expand(3, 2, 3)

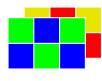

x[0:1, :, :]

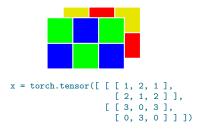

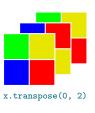

x[:, :, 0:2]

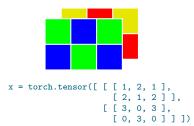

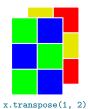

x.transpose(0, 1)

For efficiency reasons, different tensors can share the same data and modifying one will modify the others. By default do not make the assumption that two tensors refer to different data in memory.

```
>>> a = torch.full((2, 3), 1)
>>> a
tensor([[1, 1, 1],
        [1, 1, 1]])
>>> b = a.view(-1)
>>> b
tensor([1, 1, 1, 1, 1, 1])
>>> a[1, 1] = 2
>>> a
tensor([[1, 1, 1],
        [1, 2, 1])
>>> h
tensor([1, 1, 1, 1, 2, 1])
>>> b[0] = 9
>>> a
tensor([[9, 1, 1],
        [1, 2, 1])
>>> h
tensor([9, 1, 1, 1, 2, 1])
```

PyTorch offers simple interfaces to standard image databases.

```
import torch, torchvision
cifar = torchvision.datasets.CIFAR10('./cifar10/', train = True, download = True)
x = torch.from_numpy(cifar.data).permute(0, 3, 1, 2).float() / 255
print(x.dtype, x.size(), x.min().item(), x.max().item())
```

PyTorch offers simple interfaces to standard image databases.

```
import torch, torchvision
cifar = torchvision.datasets.CIFAR10('./cifar10/', train = True, download = True)
x = torch.from_numpy(cifar.data).permute(0, 3, 1, 2).float() / 255
print(x.dtype, x.size(), x.min().item(), x.max().item())
```

prints

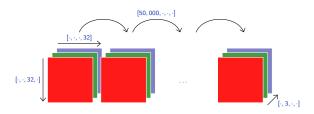

```
Files already downloaded and verified torch.float32 torch.Size([50000, 3, 32, 32]) 0.0 1.0
```

PyTorch offers simple interfaces to standard image databases.

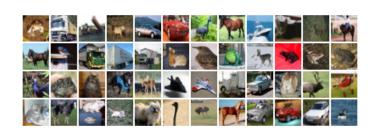

```
import torch, torchvision
cifar = torchvision.datasets.CIFAR10('./cifar10/', train = True, download = True)
x = torch.from_numpy(cifar.data).permute(0, 3, 1, 2).float() / 255
print(x.dtype, x.size(), x.min().item(), x.max().item())
```

prints

Files already downloaded and verified torch.float32 torch.Size([50000, 3, 32, 32]) 0.0 1.0

- # Narrows to the first images, converts to float x = x[:48]

Broadcasting and Einstein summations

Broadcasting automagically expands dimensions by replicating coefficients, when it is necessary to perform operations that are "intuitively reasonable". **Broadcasting** automagically expands dimensions by replicating coefficients, when it is necessary to perform operations that are "intuitively reasonable".

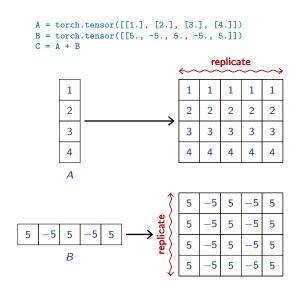

For instance:

```
>>> x = torch.empty(100, 4).normal_(2)
>>> x.mean(0)
tensor([2.0476, 2.0133, 1.9109, 1.8588])
>>> x -= x.mean(0) # This should not work, but it does!
>>> x.mean(0)
tensor([-4.0531e-08, -4.4703e-07, -1.3471e-07, 3.5763e-09])
```

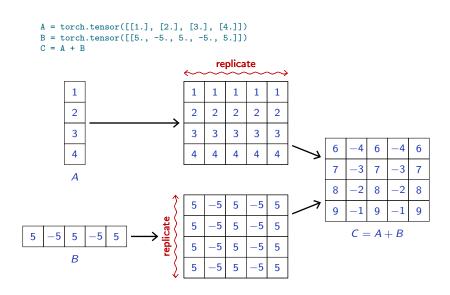

Precisely, broadcasting proceeds as follows:

- 1. If one of the tensors has fewer dimensions than the other, it is reshaped by adding as many dimensions of size 1 as necessary in the front; then
- 2. for every dimension mismatch, if one of the two tensors is of size one, it is expanded along this axis by replicating coefficients.

If there is a tensor size mismatch for one of the dimension and neither of them is one, the operation fails.

Broadcasted

Broadcasted

A powerful generic tool for complex tensorial operations is the **Einstein summation convention**. It provides a concise way of describing dimension re-ordering and summing of component-wise products along some of them.

torch.einsum takes as argument a string describing the operation, the tensors to operate on, and returns a tensor.

The operation string is a comma-separated list of indexing, followed by the indexing for the result.

Summations are executed on all indexes not appearing in the result indexing.

For instance, we can formulate that way the standard matrix product:

$$\mathbb{R}^{A \times B} \times \mathbb{R}^{B \times C} \to \mathbb{R}^{A \times C}$$

$$\forall i, k, \ m_{i,k} = \sum_{j} p_{i,j} q_{j,k}$$

$$m = \text{torch.einsum('ij,jk->ik', p, q)}$$

The summation is done along j since it does not appear after the \rightarrow .

For instance, we can formulate that way the standard matrix product:

$$\mathbb{R}^{A \times B} \times \mathbb{R}^{B \times C} \to \mathbb{R}^{A \times C}$$

$$\forall i, k, \ m_{i,k} = \sum_{j} p_{i,j} q_{j,k}$$

$$\mathbf{m} = \text{torch.einsum('ij,jk->ik', p, q)}$$

The summation is done along j since it does not appear after the \rightarrow .

Matrix-vector product:

$$\mathbb{R}^{A \times B} \times \mathbb{R}^{B} \to \mathbb{R}^{A}$$

$$\forall i, k, \ w_{i} = \sum_{j} m_{i,j} v_{j}$$

w = torch.einsum('ij,j->i', m, v)

Matrix-vector product:

$$\mathbb{R}^{A \times B} \times \mathbb{R}^{B} \to \mathbb{R}^{A}$$
$$\forall i, k, \ w_{i} = \sum_{j} m_{i,j} v_{j}$$

w = torch.einsum('ij,j->i', m, v)

Hadamard (component-wise) product:

$$\mathbb{R}^{A \times B} \times \mathbb{R}^{A \times B} \to \mathbb{R}^{A \times B}$$
$$\forall i, j, \ m_{i,j} = p_{i,j} q_{i,j}$$

m = torch.einsum('ij,ij->ij', p, q)

Matrix-vector product:

$$\mathbb{R}^{A \times B} \times \mathbb{R}^{B} \to \mathbb{R}^{A}$$
$$\forall i, k, \ w_{i} = \sum_{j} m_{i,j} v_{j}$$

w = torch.einsum('ij,j->i', m, v)

Hadamard (component-wise) product:

$$\mathbb{R}^{A \times B} \times \mathbb{R}^{A \times B} \to \mathbb{R}^{A \times B}$$
$$\forall i, j, \ m_{i,j} = p_{i,j} q_{i,j}$$

m = torch.einsum('ij,ij->ij', p, q)

Extracting the diagonal:

$$\mathbb{R}^{D\times D}\to\mathbb{R}^D$$

$$\forall i,k,\ v_i=m_{i,i}$$

v = torch.einsum('ii->i', m)

Batch matrix product:

$$\mathbb{R}^{N \times A \times B} \times \mathbb{R}^{N \times B \times C} \to \mathbb{R}^{N \times A \times C}$$
$$\forall n, i, k, \ m_{n,i,k} = \sum_{j} p_{n,i,j} q_{n,j,k}$$

m = torch.einsum('nij,njk->nik', p, q)

Batch matrix product:

$$\mathbb{R}^{N \times A \times B} \times \mathbb{R}^{N \times B \times C} \to \mathbb{R}^{N \times A \times C}$$

$$\forall n, i, k, \ m_{n,i,k} = \sum_{j} p_{n,i,j} q_{n,j,k}$$

m = torch.einsum('nij,njk->nik', p, q)

Batch trace:

$$\mathbb{R}^{N \times D \times D} \to \mathbb{R}^{N}$$

$$\forall n, \ t_n = \sum_{i} m_{n,i,i}$$

t = torch.einsum('nii->n', m)

Batch matrix product:

$$\mathbb{R}^{N \times A \times B} \times \mathbb{R}^{N \times B \times C} \to \mathbb{R}^{N \times A \times C}$$
$$\forall n, i, k, \ m_{n,i,k} = \sum_{j} p_{n,i,j} q_{n,j,k}$$

m = torch.einsum('nij,njk->nik', p, q)

Batch trace:

$$\mathbb{R}^{N \times D \times D} \to \mathbb{R}^{N}$$
$$\forall n, \ t_n = \sum_{i} m_{n,i,i}$$

t = torch.einsum('nii->n', m)

Tri-linear product along a channel:

$$\begin{split} \mathbb{R}^{N \times C \times T} \times \mathbb{R}^{N \times C \times T} \times \mathbb{R}^{N \times C \times T} &\rightarrow \mathbb{R}^{N \times T} \\ \forall n, t, \ m_{n,t} = \sum_{c} p_{n,c,t} q_{n,c,t} r_{n,c,t} \end{split}$$

m = torch.einsum('nct,nct,nct->nt', p, q, r)
